Number theory in Computer Science

Applications of number theory include:

- Cryptography/Security (primes, divisibility)
- Large integer calculations (modular arithmetic)
- Date and time calculations (modular arithmetic)
- Solving optimization problems (integer linear programming)
- Interesting examples for future topics in this course

Notation for numbers

Definition

- Natural numbers $\mathbb{N} = \{0, 1, 2, \ldots\}$
- Integers $\mathbb{Z} = \{\ldots, -1, 0, 1, 2, \ldots\}$
- Positive integers $\mathbb{N}_{>0} = \mathbb{Z}_{>0} = \{1, 2, \ldots\}$

- Rational numbers (fractions) $\mathbb{Q} = \{ \frac{m}{n} : m, n \in \mathbb{Z}, n \neq 0 \}$
- Real numbers (decimal or binary expansions) $\mathbb{R}$
  $r = a_1 a_2 \ldots a_k . b_1 b_2 \ldots$

In $\mathbb{N}$ and $\mathbb{Z}$ different symbols denote different numbers.
In $\mathbb{Q}$ and $\mathbb{R}$ the standard representation is not necessarily unique.

NB

Proper ways to introduce reals include Dedekind cuts and Cauchy sequences, neither of which will be discussed here. Natural numbers etc. are either axiomatised or constructed from sets $(\,0 \stackrel{def}{=} \{\},\ n+1 \stackrel{def}{=} n \cup \{n\}\,)$ 公式化

Intervals

Intervals of numbers (applies to any type)

$$[a, b] = \{x : a \leq x \leq b\}; \qquad (a, b) = \{x : a < x < b\}$$
$$[a, b) = \{x : a \leq x < b\}; \qquad (a, b] = \{x : a < x \leq b\}$$

$$(-\infty, b] = \{x : x \leq b\}; \qquad (-\infty, b) = \{x : x < b\}$$
$$[a, \infty) = \{x : a \leq x\}; \qquad (a, \infty) = \{x : a < x\}$$

NB

$(a, a) = (a, a] = [a, a) = \emptyset$; *however* $[a, a] = \{a\}$.

Intervals of $\mathbb{N}, \mathbb{Z}$ are finite: if $m \leq n$

$$[m, n] = \{m, m + 1, \ldots, n\}$$

Floor and ceiling

Definition

$\lfloor . \rfloor : \mathbb{R} \longrightarrow \mathbb{Z}$ — **floor** of x, the greatest integer $\leq x$
$\lceil . \rceil : \mathbb{R} \longrightarrow \mathbb{Z}$ — **ceiling** of x, the least integer $\geq x$

Example

$\lfloor \pi \rfloor = 3 = \lceil e \rceil \qquad \pi, e \in \mathbb{R};\ \lfloor \pi \rfloor, \lceil e \rceil \in \mathbb{Z}$

Simple properties

- $\lfloor -x \rfloor = -\lceil x \rceil$, hence $\lceil x \rceil = -\lfloor -x \rfloor$
- $\lfloor x + t \rfloor = \lfloor x \rfloor + t$ and $\lceil x + t \rceil = \lceil x \rceil + t$, for all $t \in \mathbb{Z}$

Fact

Let $k, m, n \in \mathbb{Z}$ such that $k > 0$ and $m \geq n$. The number of multiples of k in the interval $[n, m]$ is

$$\left\lfloor \frac{m}{k} \right\rfloor - \left\lfloor \frac{n-1}{k} \right\rfloor$$

Divisibility

Definition

For $m, n \in \mathbb{Z}$, we say m **divides** n if $n = k \cdot m$ for some $k \in \mathbb{Z}$.

We denote this by $m|n$

Also stated as: 'n is divisible by m', 'm is a divisor of n', 'm is a multiple of n'

$m \nmid n$ — negation of $m|n$

Notion of divisibility applies to all integers — positive, negative and zero.

$1|m$, $-1|m$, $m|m$, $m|-m$, for every m

$n|0$ for every n; $0 \nmid n$ except $n = 0$

Definition

Let $m, n \in \mathbb{Z}$. must be positive!!!!!!

- The **greatest common divisor** of m and n, $\gcd(m, n)$ is the largest positive d such that $d|m$ and $d|n$.
- The **least common multiple** of m and n, $\mathrm{lcm}(m, n)$, is the smallest positive k such that $m|k$ and $n|k$.

NB

$\gcd(m, n)$ *and* $\mathrm{lcm}(m, n)$ *are always taken as positive, even if* m *or* n *is negative.*

$$\begin{aligned} \gcd(-4, 6) = \gcd(4, -6) = \gcd(-4, -6) = \gcd(4, 6) &= 2 \\ \mathrm{lcm}(-5, -5) = \dots &= 5 \end{aligned}$$

Primes and relatively prime

Definition

- A number $n > 1$ is **prime** if it is only divisible by ± 1 and $\pm n$.
- m and n are **relatively prime** if $\gcd(m, n) = 1$

Absolute Value

Definition

$$|x| = \begin{cases} x & , \text{ if } x \geq 0 \\ -x & , \text{ if } x < 0 \end{cases}$$

Fact

$\gcd(m, n) \cdot \operatorname{lcm}(m, n) = |m| \cdot |n|$

Euclid's gcd Algorithm

$$\gcd(m,n) = \begin{cases} m & \text{if } m = n \\ \gcd(m-n,n) & \text{if } m > n \\ \gcd(m,n-m) & \text{if } m < n \end{cases}$$

Fact

For $m > 0, n > 0$ the algorithm always terminates. (Proof?)

Fact

For $m, n \in \mathbb{Z}$, if $m > n$ then $\gcd(m,n) = \gcd(m-n,n)$

Proof.

For all $d \in \mathbb{Z}$, ($d|m$ and $d|n$) if, and only if, ($d|m-n$ and $d|n$):

Euclid's gcd Algorithm
